Prerequisites for This Guide

The following guide will assist you to setup a remote and online connection to the a Twido controller placed on the customer site using the Twido Suite software.

This guide concentrates on the Twido TWDLCAE40DRF controller attached to the SiteManager via the USB-to-RS485 converter (TSXCUSB485), but may also work with other USB enabled Twido PLCs and software packages.

Prerequisites for this guide are:

- You have an operational LinkManager installed on your PC with a LinkManager certificate that allows you to connect to the SiteManager agents.
- You have the Twido PLC and the Twido designer software installed on your PC.
- You have connected the SiteManager with a USB cable to the USB-to-RS485 converter (set to TER MULTI), which is connected to the Twido PLC using the Twido programming cable.
- You have configured the agent on the SiteManager to type **Schneider Electric / USB Adapter**.

If this is not the case, we kindly ask you to contact the person / department responsible within your own company or at the company responsible hereof.

System Overview

The communication path is as follows:

Twido Suite → **LinkManager** → GateManager → SiteManager → PLC.

This guide will elaborate on the components marked with **bold**.

The following system overview depicts a SiteManager 1029 at the customer location:

1. USB Connection

The following steps have been performed with Twido Suite software and USB drivers already installed on the same PC where the LinkManager is activated.

1. Locate the agent configured with the Twido USB device and click on it to establish a connection to it:

2. Select the mode you want to operate in. In this guide, "Programming" Mode is used.

3. Connect to the PLC to upload the program from the PLC, by selecting "Open an existing project".

4. Select the Controller, and click the Load button at the bottom of the window.

5. the Twido Suite will now search the installed COM ports on the computer for the PLC (A COM port in this case is mapped to a USB driver)

6. Next, it will show a list of available COM ports. If you are unsure of what COM port to use, check the MODBUS driver, which was installed during the Twido Suite installation. In this scenario, we can launch the MODBUS Serial Driver by right-clicking on the icon in the system tray, and select configure.

7. In the dropdown-menu, notice the COM port marked (ready). In this example it is COM6.

8. Revert to the Twido Suite, and select the corresponding COM port (in this case, COM6). Then, click OK.

- The Twido Suite will now connect to the PLC, and upload the project.

- You are now online with the PLC.

2. USB connection via Windows XP under VMWare

You can run the Twido Suite software inside a VMWare engine, to a Twido PLC that is USB attached to a SiteManager.

Important: Note that LinkManager can only run inside VMWare if the host OS is Windows 7 and the PC's CPU has support for virtualization.

The following illustrates VMWare Player, which can be downloaded from <http://www.vmware.com/support/product-support/player/>, and for LinkManager running outside the virtual machine (i.e. on the host system)

1. Locate your Windows XP that has the Twido Suite installed, and enter **Edit virtual machine settings**.

2. Make sure that **USB Controller** has been added as Hardware component:

3. Start the VMWare engine and the LinkManager inside the VMWare engine.
4. Follow the procedure of section 1 on page 4 to get access to the PLC via LinkManager.
